

Models & registration

project · recorded with runs

Reset page to defaults

Defaults for new training jobs and the checks a model must pass to be registered.

Evaluation split set aside before training

test portion	20 %	validation	10 %	
split	blocked by time within each channel			never a random sample of windows
gap between blocks	≥ window + 0 s			the minimum is one window and cannot go lower
linked recordings	never split across sides			fs1 and fs2 of one recording stay on one side
warn below N test windows per class	50			

Training

label arms	manual	cluster	RF baseline	the random-forest baseline is always trained
train on windows labelled in every arm	☒			
repeat with different seeds	☐	3 repeats		
early stopping patience	10 epochs			

Calibration per class, on the validation block

suggested threshold at precision	0.80	shown in the Threshold stage as its recommended value
reliability bins	10	

Registration gate the researcher has the final say

check	threshold	if it fails
beats the label-shuffle null	p < 0.01	blocks registration
beats the random-forest baseline	ΔF1 CI excludes 0	blocks registration
test windows unseen in training	always	blocks registration
calibration per class	ECE ≤ 0.10	warning · needs a reason
human verification sample	stratified by class, 40	—
agreement with the human sample	≥ 80 %	warning · needs a reason
sign-off recorded with the model	always	required
retiring a model a template still uses	blocked	the list of templates is shown instead
